

# Hands-on Exercise: Working With With CSS

# Working With CSS Practically

- Often we might not be writing all the CSS from scratch
- Instead, we are likely to use a CSS Generator site such as <https://cssgenerator.org/text-shadow-css-generator.html>

# Task 1: Text Shadow CSS Generator (Inline)

1. Visit <https://cssgenerator.org/text-shadow-css-generator.html>
2. Play around with the settings on the page and generate a text shadow effect of your choice

# Task 1: Text Shadow CSS Generator (Inline)

3. Incorporate the text-shadow into your `page.html`

```
<!DOCTYPE html>
<html lang="en">
  <head>
    <meta charset="UTF-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <title>Document</title>
  </head>
  <body>
    <p style="text-shadow: -5px 4px 8px rgba(0,0,0,0.69);">Hello World</p>
  </body>
</html>
```

## Task 2: Text Shadow CSS Generator (Internal Stylesheets)

1. Try convert the previous **inline styling** example to be using **internal stylesheets** instead

```
...  
<head>  
  ...  
  <style>  
    .shadow-text{  
      text-shadow: -5px 4px 8px rgba(0,0,0,0.69);  
    }  
  </style>  
</head>  
...
```

## Task 2: Text Shadow CSS Generator (Internal Stylesheets)

1. Try convert the previous **inline styling** example to be using **internal stylesheets** instead

```
...  
<body>  
  <p class="shadow-text">Hello World</p>  
</body>  
...
```

Questions to reflect on:

- How do you convert this example to using external stylesheets instead?
