

Lab: Setting Up a Movies Database

Please note that this lab is **not graded**. It emphasises practical skills in setting up and managing a MongoDB database, including creating collections, inserting documents, and querying data. The answer file is available [here](#) [↓](#). We encourage you to try this lab exercise independently.

Setting Up a Movies Database:

- First, connect to your MongoDB cluster that was set up as part of the previous lab exercise using your username and password.
- Setting Up a MongoDB Atlas Account and Free Cluster on Atlas. It should look something like this:

```
mongo "mongodb+srv://cluster0-zlury.mongodb.net/test" -
```

- Now, create the movies database and call it `moviesDB` with the mongosh shell. Utilise the `use` command:

```
use moviesDB
```

- Create the movie collection with a few relevant attributes.
- Create the collection by inserting the documents into a nonexistent collection. You are encouraged to think and implement collections with attributes that you find most suitable:

```
db.movies.insertMany([
  {
    "title": "Rocky",
    "releaseDate": new Date("Dec 3, 1976"),
    "genre": "Action",
    "about": "A small-time boxer gets a supremely rare chance to fight a heavy-weight champion in a bout in which he strives to go the distance for his self-respect.",
    "countries": ["USA"],
    "cast": ["Sylvester Stallone", "Talia Shire", "Burt Young"],
    "writers": ["Sylvester Stallone"],
    "directors": ["John G. Avildsen"]
  },
  {
    "title": "Rambo 4",
    "releaseDate": new Date("Jan 25, 2008"),
    "genre": "Action",
    "about": "In Thailand, John Rambo joins a group of mercenaries to venture into war-torn Burma, and rescue a group of Christian aid workers who were kidnapped by the ruthless local infantry unit.",
    "countries": ["USA"],
    "cast": ["Sylvester Stallone", "Julie Benz", "Matthew Marsden"],
    "writers": ["Art Monterastelli", "Sylvester Stallone"],
    "directors": ["Sylvester Stallone"]
  }
])
```

- Use the `find` command to fetch the documents you inserted in the previous step, that is, `movies.find().pretty()`. It should return the documents
- You may also like to store awards information in your movies database. Create an awards collection with a few records. You are encouraged to think and come up with your own collection name and attributes. Here are the commands to insert a few sample documents in your awards collection:

```

db.awards.insertOne(
{
  "title": "Oscars",
  "year": "1976",
  "category": "Best Film",
  "nominees": ["Rocky", "All The President's Men", "Bound
For Glory", "Network", "Taxi Driver"],
  "winners" :
  [
    {
      "movie" : "Rocky"
    }
  ]
}
)

```

- Run the find command to get the documents from the awards collection. The lines starting with // (a double slash) are comments, which are only for the purpose of description; the database does not execute them as commands:

```
// find all the documents from the awards collection
```

```
db.awards.find().pretty()
```

- This exercise was for you to add as many collections/documents as you think are required to store the movie data effectively and efficiently. Feel free to add any more relevant collections and documents. Congratulations you have completed the lab!
